No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                          Score

COMP WO9950294-A1. Carybdea rastonii. Hemolytic protein; blood platelet agglutination; drug development; treatment; sting; jellyfish; pharmaceutical; pesticide. C. rastonii hemolytic protein derived 06-JAN-2000 01-APR-1998; 30-MAR-1999; 07-OCT-1999. AAY33648; AAY33648 standard; peptide; (SUNR) SUNTORY LTD. Н (first entry) 98JP-0088569. 99WO-JP01607 14 Ą peptide

mechanism Protein with hemolytic activity, useful for drugs treating jelly fish stings, pharmaceuticals with blood platelet agglutination activity, setticides by use of the hemolytic activity, and study of the hemolytic activity.

                                                                                                                                                                                                                         useful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072).
                                                                                                                                                                                          The sequence data for this patent did not form specification, but was obtained in electronic i
                                                                                                                                                                                                                                                                                                                        The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention

P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The conspective for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and country of the antibodies may also be used as consequence in the determining P. acnes polypeptides and country of the sequence data for this patent did not form part of the printed consequence data for this patent did not format directly from WIPO

(I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical
                                                                                                                                                                                                                                                                                                                                                                                                                         and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences fithe invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from William at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutation responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         30-MAR-2001;

                                                                RESULT
                                                                                                                 밁
                                                                                                                                             Ş
                                                                                                                                                                                                                                                                                                                                          CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC polymucleotides are also used in diagnostics as expressed sequence tags CC for identifying expressed genes. (I) is useful in gene therapy techniques CC to restore normal activity of (II) or to treat disease states involving CC (II). (II) is useful for generating antibodies against it, detecting or CC quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical CC imaging of sites expressing (II). (I) and (II) are useful for treating CC disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations CC responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and CC diagnostics amino acid sequences. ABG00010-ABG30377 represent novel human CC diagnostic amino acid sequences of the invention.

cc gynaecological, cardiant and antiinflammatory activities, and can be used con in gene therapy. The polynucleotide and proteins can be used for corrections, treating, or ameliorating a medical condition or in assays cfor diagnosing a pathological condition or a susceptibility to one in a complete. Binding partners to the proteins and the activity of the proteins can be identified. The pancreatic cancer antigens can be used to detect, treat or prevent pancreatic disorders, especially cancer.

Cc Agonists and antagonists to the antigens can be screened for The pancreatic cancer antigens can be used to design nucleic candity by a concertant disorders, especially cancer the cancer antigen polynucleotides can be used to design nucleic candity by addition probes that can be used in chromosome mapping, linkage and diagnostic methods. The proteins can be used to generate antibodies which are used to purify, detect and target the polypeptides, including both in vivo and in vitro diagnostic and therapeutic methods. The proteins can be used to treat or prevent neural, immune system, muscular, corrections and contractions and contractions and contractions are used to treat or prevent neural, immune system, muscular, corrections are sentential culturary.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 g
The present sequence is that of human protein tyrosine phosphatase HPTP-beta, a member of subclass III receptor type PTPs, bearing fibronectin type III-like repeats in the extracellular domain and a single catalytic domain in the cytoplasmic tail. HPTP-beta is a vascular-endothelial protein tyrosine phosphatase (VE-PTP) that specifically interacts with receptor-type tyrosine kinase Tie-2, modulating its tyrosine phosphorylation. Tie-2.1s involved in angiogenetic processes, the formation of blood vessels during
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     construction and membrane transport (MCT) proteins given in AAB76510 to AAB76847. The MCT nucleic acids and proteins are useful in the identification of microorganisms which can be used to produce fine chemicals, for modulating fine chemical production in C. glutamicum or related bacteria (e.g. Brevibacterium lactofermentum), the typing or identification of C. glutamicum or related bacteria, as reference points for mapping C. glutamicum genome, and as markers for transformation. AAF68082 and AAF68082 represent sequencing primers which are used in an

The invention relates to polynucleotides (AAKS1456-AAKS3435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating cytokine, cell proliferation or cell differentiation or which may indu production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines peptide therapy. The polypeptides have various cytokine-like activitie e.g. stem cell growth factor activity, haematopoiesis regulating

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0
```

cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating

amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office.
                                                                                                                   The present invention provides a number of the present invention provides a present invention. These sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nakagawa

                                              pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 21-APR-2000;

      Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    -!- CATALYTIC ACTIVITY: Protein tyrosine phosphate + H(2)O - protein tyrosine + Phosphate.

tyrosine + phosphate.
-!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- SIMILARITY: CONTAINS 1 PROTEIN-TYROSINE PHOSPHATASE DOMAIN.
-!- SIMILARITY: CONTAINS 16 FIBRONECTIN TYPE III-LIKE DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      MIM; 176882

FUNCTION: MAY PLAY A ROLE IN CEREBELLAR DEVELOPMENT. CAN ACTIVATE FUNCTION: MAY BE USURGOGENIN-RELATED-1, AND INITIATE NEURAL AND THE PRONEURAL GENE NEUROGENIN-RELATED SUFFERENCE AND MAY BE NEURONAL DIFFERENTIATION. MAY MEDIATE NEURAL COMPETENCE AND MEDIAL CREST INVOLVED IN ACTIVATION OF MIDBRAIN, DORSAL NEURAL AND NEURAL CREST FATES; CAN SENSITIZE THE PRESUMPTIVE NEURECTODERM FOR INDUCTION, SUGGESTING THAT IT MAY BE A NEURAL COMPETENCE FACTOR. AN ACTIVATED FORM OF OPL CAN ACTIVATE NEURAL CREST AND DORSAL NEURAL TUBE FORM OF OPL CAN ACTIVATE NEURAL CREST AND DORSAL NEURAL TUBE
CEREBELLUM.

CEREBELLUM. STAGE: FIRST DETECTED AT THE BEGINNING OF DEVELOPMENTAL STAGE: FIRST DETECTED AT THE BEGINNING OF ASTRULATION. IT IS ACTIVATED ZYGOTICALLY BY LATE BLASTULA. ITS GASTRULATION. IT IS EXPRESSION IS MAXIMAL BY MIDGASTRULA, WITH LOWER EXPRESSION PROPERSISTING ANTO TAILBUD STAGES. DURING EARLY GASTRULA STAGES IT I EXPRESSION IN THE PROSPECTIVE EXPRESSION BUILDLY IN THE DORSAL ECTODERM. WHEN NEURAL INDUCTION OCCURS, IT HAS WIDE AND HOMOGENOUS EXPRESSION IN THE PROSPECTIVE REUROECTODERM. LATER, AT LATE GASTRULA STAGES, ITS EXPRESSION IS SHUT OFF IN THE DORSAL MIDLINE EXCEPT IN THE MOST ANTERIOR AREA. AT NEURAL PLATE STAGES, IT IS EXPRESSED IN THE LATERAL PART OF ANTERIOR NEURAL PLATE STAGES, IT IS EXPRESSED IN THE LATERAL PART OF ANTERIOR NEURAL PLATE AND IN THE FLANKING ECTODERM. AT LARVAL

FUNCTION: MAY ACT AS AN INTRACELLULAR SIGNALING COMPONEN
CONTROLLED BY RAS SIGNALING PATHWAYS.
SUBUNIT: BINDS DIRECTLY TO 20-1 AND OCCLUDIN.
SUBCELLULAR LOCATION: Cytoplasmic (Probable).
ALTERNATIVE PRODUCTS: 3 ISOFORMS; 1, 2 (SHOWN HERE) AND
PRODUCED BY ALTERNATIVE SPLICING.
DISEASE: INVOLVED IN ACUTE LEUKEMIAS BY A CHROMOSOMAL
THERESULT IS A ROCUE ACTIVATOR PROTEIN.

The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures
                                              Novel polynucleotides derived from Coryneform bacteria, for identifying mutation point of a gene, measuring expression of a gene, analysing expression profile or pattern of a gene and identifying homologous gene
                                                                                                           WPI; 2001-376931/40.

Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine: The present sequence is a protein described in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                    sequences from the Coryneform bacterium Corynebacterium glitamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived
